Student Study Tracker System

Students often find it difficult to keep track of how much time they spend studying and whether they are making consistent progress toward their academic goals. Many students rely on memory or manual notes, which can be inaccurate and difficult to manage over time. A study tracking system can help students monitor their study habits, stay organized, and improve their productivity.

The Student Study Tracker System is a Python-based application that allows students to record study sessions, track study hours for different subjects, set daily goals, and view their progress through reports and charts. The system aims to encourage better study habits and provide students with useful insights into their learning activities.

Problem Statement

Many students do not have an effective way to monitor their study activities and learning progress. As a result, they may struggle with time management, consistency, and achieving their academic goals. Existing methods such as notebooks or spreadsheets can be difficult to maintain and analyze. Therefore, there is a need for a simple and user-friendly system that helps students track their study sessions and visualize their progress.

Project Scope and Details

The Student Study Tracker System is a productivity system designed to help students manage and monitor their study activities. Users will be able to record study sessions, organize subjects, set study goals, and analyze their learning progress.

The system will maintain study records using a database and provide visual reports through charts and graphs. It will offer a simple graphical user interface that allows students to easily interact with the application and manage their study information.

Objectives

- To develop a system for tracking study hours and study sessions.
- To allow students to manage different subjects efficiently.
- To help students set and achieve daily study goals.
- To provide weekly and monthly progress reports.
- To visualize study data using charts and graphs.
- To encourage consistent study habits through streak tracking and motivational reminders.
- To gain practical experience in Python application development.

Technologies Used

- Python
- Simple Tkinter GUI
- SQLite Database or File Handling
- Matplotlib (Data Visualization)
- GitHub (Version Control and Weekly Progress Updates)

Expected Features

- User Login System
- Study Session Logging
- Subject Management
- Daily Study Goal Tracking
- Study Streak Counter
- Weekly and Monthly Reports
- Progress Analytics
- Data Visualization Using Charts

Week-by-Week Deliverables

Week 4

- Project topic selection
- Project research and discussion
- Define project scope and objectives
- Prepare project deliverable document
- Create GitHub repository

Week 5

- Design project structure
- Create database plan
- Develop basic study session logging functionality
- Implement subject management module
- Push initial code to GitHub

Week 6

- Integrate SQLite database
- Store and retrieve study records
- Develop daily study goal feature
- Test database operations
- Update GitHub repository

Week 7

- Develop graphical user interface using Tkinter
- Create dashboard and user interaction screens
- Connect GUI with database

- Implement progress tracking features
- Push updated code to GitHub

Week 8

- Add charts and analytics using Matplotlib
- Implement study streak tracking
- Perform testing and bug fixing
- Complete project documentation
- Prepare presentation slides
- Final project submission
- Final GitHub update

Work Division

Member 1 (Sahil Khan Miya) - Lead Developer

- Project planning and coordination
- Main coding and system integration
- Database implementation
- GUI development
- Final testing and debugging

Member 2 (Aditya Yadav) - Backend Developer

- Study session module development
- Subject management features
- Assist in testing

Member 3 (Sujal Lama) - Data and Analytics Developer

- Progress tracking module

- Chart and analytics implementation
- Documentation support

Member 4 (Samrat Jung Shahi) - Quality Assurance and Documentation Coordinator

- User interface improvements
- GitHub maintenance and updates
- Testing and bug reporting
- Presentation preparation

Learning Expectations

- Practical application of Python programming concepts
- Function and module development
- Basic Object-Oriented Programming (OOP)
- Database management using SQLite
- GUI development using Tkinter
- Data visualization using Matplotlib
- Software testing and debugging
- Team collaboration and project management
- GitHub version control and project documentation

Conclusion

The Student Study Tracker System is a practical application that helps students monitor and improve their study habits. The project combines Python programming, database management, graphical user interface development, and data visualization into a single system. By completing this project, the team will gain valuable hands-on experience in software development while creating a useful tool for students.
